SP76 Compliant Coalescing Housings

Our SP76 compliant coalescing filter housings are designed to fit SP76 modular sample systems.

The unique designs allow liquids to be removed from gas samples with the standard SP76 footprint.

The head to bowl design allows easy access to the standard size coalescing filter elements.

New!

The housings have a number of port options so the substrate can be mounted vertically or horizontally. The housing is shown here mounted on the MS³ modular substrate from Circor Instrumentation.
