

Automatic Float Drains

To remove liquids automatically from a system with a positive pressure we have two solutions -

The DF105 series automatic float drain uses a unique diaphragm operated valve and is constructed entirely from 316L stainless steel for use in corrosive applications.

Water drains from the coalescing housing into the drain body and as the water level increases a float controls the diaphragm operation of the valve. Once the water is drained the float returns to the rest position and the valve closes.

For lower pressure non-corrosive applications the DN103 series automatic float drain uses a self-contained plastic float mechanism to remove water in a similar way to the DF105 series.

As well as our standard stocked housings we offer a service to create custom housings to suit your application. Just let us know what you need.
